

Audio Instructions

The game ships with **procedurally synthesised sound effects and music** (see `Assets/Scripts/Managers/AudioManager.cs`), so it is audible without any imported audio. To use your own audio, import clips here and register them — a registered clip overrides the synthesised default with the same key.

Sound keys used by the game

Key	When it plays	Suggested type
<code>player_shot</code>	Player fires	Short laser/“pew”
<code>enemy_shot</code>	Enemy fires	Lower-pitched shot
<code>explosion</code>	Enemy/player destroyed	Noise burst
<code>player_hit</code>	Player takes damage	Low thud / alarm
<code>powerup</code>	Power-up collected	Rising chime
<code>ui_click</code>	UI button pressed	Soft click
<code>wave</code>	New wave begins	Short fanfare
<code>music</code>	Looping background music	Ambient loop

Import settings

- **`player_shot` / `enemy_shot` / `explosion` / `player_hit` / `powerup` / `ui_click` / `wave`**
 - Load Type: `Decompress On Load`
 - Preload Audio Data: on
 - Format: PCM or Vorbis
- **`music`**
 - Load Type: `Streaming`
 - Loop the asset itself, or rely on the looping `AudioSource` (already configured).

Registering custom clips

After the managers initialise (e.g. from any script that runs after the bootstrap), call:

```
using SpaceShooter.Managers;
```

```
AudioManager.Instance.RegisterClip("explosion", myExplosionClip);  
AudioManager.Instance.RegisterClip("music", myMusicClip);
```

A simple integration approach:

1. Put your clips in `Assets/Resources/Audio/` .
2. In a small `MonoBehaviour` (added to the `GamePlay` scene, or extend `GameBootstrap`), load and register them:

```
AudioManager.Instance.RegisterClip("player_shot",  
    Resources.Load<AudioClip>("Audio/player_shot"));
```

Volume can be tuned at runtime via `AudioManager.Instance.SetSfxVolume(0..1)` and `SetMusicVolume(0..1)` .
