

Prefabs

Unity creates prefab assets (`.prefab` files) when you drag a configured `GameObject` from the scene Hierarchy into this folder. They can't be hand-authored here, so this file lists exactly which prefabs to create and how to configure each.

See “**Step 4: Create the Prefabs**” in the root `README.md` for full steps.

Prefabs to create

1. PlayerBullet

- `SpriteRenderer` (small thin sprite, e.g. cyan)
- `BoxCollider2D` / `CircleCollider2D` with **Is Trigger = true**
- `Bullet` component (direction set at runtime by the shooter)
- Tag: (none required)

2. EnemyBullet

- Same as `PlayerBullet` but a different color (e.g. red)
- `Bullet` component

3. Enemy

- `SpriteRenderer` (enemy ship sprite)
- `Collider2D` with **Is Trigger = true**
- `Rigidbody2D` (Body Type = Kinematic, Gravity Scale = 0)
- `Enemy` component
- `HealthSystem` component (maxHealth ~50)
- Tag = “**Enemy**”

4. PowerUp_Health, PowerUp_RapidFire, PowerUp_Shield

- `SpriteRenderer` (distinct color/icon per type)
- `Collider2D` with **Is Trigger = true**
- `PowerUp` component with the matching `type` selected

5. Player (optional prefab; can also live only in the scene)

- `SpriteRenderer` (player ship sprite)
- `Collider2D` with **Is Trigger = true**
- `Rigidbody2D` (Kinematic, Gravity Scale = 0)
- `PlayerController` + `HealthSystem`
- Tag = “**Player**”
